

Dirac Delta Function

Definition 1.

$\delta(x)$ is a generalized function satisfies:

$$\delta(x) := \begin{cases} 0, & x \neq 0 \\ +\infty, & x = 0 \end{cases}, \quad (1)$$

$$\int_{-\epsilon}^{+\epsilon} \delta(x) dx = 1, \quad \epsilon > 0. \quad (2)$$

All the equalities should be understand under integration.

Property 1.

$$\delta(-x) = \delta(x). \quad (3)$$

Proof.

$$\delta(-x) = \begin{cases} 0, & x \neq 0 \\ +\infty, & x = 0 \end{cases}, \quad (4)$$

$$\int_{-\epsilon}^{+\epsilon} \delta(-x) dx = - \int_{+\epsilon}^{-\epsilon} \delta(-x) d(-x) = \int_{-\epsilon}^{+\epsilon} \delta(x) dx, \quad \epsilon > 0. \quad (5)$$

Property 2.

$$\delta(ax) = \frac{1}{|a|} \delta(x) \quad (a \neq 0). \quad (6)$$

Proof.

$$\delta(ax) = \begin{cases} 0, & x \neq 0 \\ +\infty, & x = 0 \end{cases} = \frac{\delta(x)}{|a|}, \quad (7)$$

$$\int_{-\epsilon}^{+\epsilon} \delta(ax) dx = \begin{cases} \frac{1}{a} \int_{-\epsilon}^{+\epsilon} \delta(ax) d(ax), & a > 0 \\ \frac{1}{a} \int_{+\epsilon}^{-\epsilon} \delta(ax) d(ax), & a < 0 \end{cases} = \frac{1}{|a|} \int_{-\epsilon}^{+\epsilon} \delta(x) dx. \quad (8)$$

Property 3.

$$f(x)\delta(x-a) = f(a)\delta(x-a). \quad (9)$$

Property 4.

$$\int \delta(x-y)\delta(y-a) dy = \delta(x-a). \quad (10)$$

Property 5.

$$\delta(x) = \frac{1}{2\pi} \int_{-\infty}^{+\infty} e^{ikx} dk. \quad (11)$$

Proof.

Add a convergence factor to soft cutoff the divergent integration.

$$\frac{1}{2\pi i} \int_{-\infty}^{+\infty} e^{ikx} e^{-\epsilon k^2} dk = \frac{e^{-\frac{x^2}{4\epsilon}}}{2\sqrt{\pi\epsilon}}. \quad (12)$$

Then check it like above proof.

Property 6.

$$\delta[g(x)] = \sum_n \frac{\delta(x - x_n)}{|g'(x_n)|}, \quad g(x_n) = 0, g'(x_n) \neq 0. \quad (13)$$

Proof.

Around $x = x_n$,

$$g(x) = g(x_n) + g'(x_n)(x - x_n) = g'(x_n)(x - x_n) \quad (14)$$

Thus,

$$\delta[g(x)] = \delta\left(\sum_n g'(x_n)(x - x_n)\right) = \sum_n \delta[g'(x_n)(x - x_n)]. \quad (15)$$

By Property 2,

$$\delta[g(x)] = \sum_n \frac{1}{|g'(x_n)|} \delta(x - x_n), \quad g(x_n) = 0, g'(x_n) \neq 0. \quad (16)$$

For those $g(x_n) = 0, g'(x_n) = 0$, take $2 \leq m = \min(\{m \in \mathbb{N} \mid g^m(x_n) \neq 0\})$. Then we induct on m that

$$\delta[g^m(x_n)(x - x_n)^m] = 0. \quad (17)$$

For $m = 2$,

$$\delta[g''(x_n)(x - x_n)^2] = \quad (18)$$
