## Problem 1: Four springs harmonic oscillation

Consider the mass attached to four identical springs, as shown in Figure. Each spring has force constant k and unstretched length  $l_0$ , and the length of each spring when the mass is at its equilibrium at the origin is a (not necessarily the same as  $l_0$ ). When the mass is displaced a small distance to the point (x, y), show that its potential energy has the form  $\frac{1}{2}k'r^2$  appropriate to an isotropic harmonic oscillator. What is the constant k' in terms of k? Give an expression for the corresponding force.

## Problem 2: Driven harmonic oscillation

A spar buoy of uniform cross-section floats in a vertical position with a length L submerged when there are no waves on the ocean. Please describe the motion of the spar buoy when there are sinusoidal waves of height h (crest to trough) and the period T on the ocean.

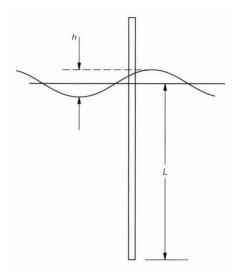

Figure 2: The spar buoy in the ocean

## Problem 3: Damped harmonic oscillation I

A mass m is suspended from a spring of force constant k in a medium which exerts a damping form  $-m\gamma dx/dt$ .

1. For the case of under damped motion find the complete solutions for the position x = x(t) of m for all times t > 0 for the following driving forces:

(a) 
$$F = \begin{cases} 0 & \text{for } t < 0 \\ F_0 & \text{for } t \ge 0 \end{cases}$$
 (1)

(b) 
$$F = \begin{cases} 0 & \text{for } t < 0 \\ F_0 \cos \omega_0 t & \text{for } t \ge 0 \end{cases}$$
 
$$\omega_0 = \sqrt{k/m}$$
 (2)

2. If the oscillator is driven by a sinusoidal force  $F = F_0 \cos \omega t$  and we consider long times, what is the frequency  $\omega^*$  for which the amplitude reaches a maximum?

## Problem 4: Damped oscillation II

Consider a damped oscillator, with natural frequency  $\omega_0$  and damping constant  $\beta$  both fixed, that is driven by a force  $F(t) = F_0 \cos \omega t$ .

- 1. Find the rate P(t) at which F(t) does work and show that the average rate  $\langle P \rangle$  over any number of complete cycles is  $m\beta\omega^2A^2$ .
- 2. Verify that this is the same as the average rate at which energy is lost to the resistive force.
- 3. Show that as w is varied  $\langle P \rangle$  is maximum when  $\omega = \omega_0$ ; that is, the resonance of the power occurs at  $\omega = \omega_0$  (exactly).
